Information on the coronavirus (COVID-19)

Can the virus be transmitted by food?

"There is currently no evidence that food is a source of infection or that the virus could be transmitted via food". (efsa)

The BfR also states that there are currently no cases in which it has been proven that people have become infected through the consumption of food. We have attached both sources as LINK for you.

Milk and dairy products are therefore to be classified as not affected and harmless based on the current state of knowledge.
